

Narcan (Naloxone)

What is Narcan?

Narcan (naloxone) is a drug that can reverse the effects of a deadly opioid overdose, Narcan is administered into the nose via a user friendly nasal spray.

How to Use Narcan Spray:

1. Remove the device from the packaging.
2. Gently insert the top of the nozzle into either nostril.
3. Press the plunger firmly to administer the dose.
4. Call for emergency medical help.
5. Watch the person closely. If the person does not respond by waking up to voice or touch, or breathing normally another dose may be given.

In nearly **40%** of overdose deaths, someone else was present.

Why Carry Narcan:

Anyone can carry Narcan, give it to someone experiencing an overdose, and potentially save a life. Narcan won't harm someone if they are not overdosing on opioids, so it's best to act fast when an overdose is suspected. Narcan is available at your local pharmacy without a prescription!
